I. INTRODUCTION

A. Purpose of Study

This Preliminary Study shall provide the offsite and onsite hydrologic and hydraulic analyses in accordance to the San Bernardino County drainage requirements. The proposed site consists of an area of approximately 2.50 acres of commercial development. The commercial development shall be constructed in up to three phases. Offsite streets that surround the development shall be improved to continue and perpetuate offsite runoff to its natural drainage pattern. Palisades Drive shall be half improved in accordance to the standards of street design per Town of Yucca Valley standard drawing. Sidewalk, curb/gutter and commercial driveways are proposed for this development. Twenty-nine Palms Highway 62 roadway improvements shall be installed per Town and CalTrans requirements.

Hydrologic and hydraulic calculations were performed using methodologies defined in the *San Bernardino County Flood Control District Hydrology Manual* (August 1986).

B. Scope

This Preliminary Study involves the hydrologic analyses of approximately 45.11 acres of offsite watershed that will impact Prescott Street adjacent to the proposed project site.

This site is currently bounded by existing residential lots and Palisades Drive to the south, Prescott Avenue to the west, Twentynine Palms Highway (State Route 62) to the north and an existing medical complex to the east.

Pre-development peak runoff values for the 100-year, 1 hour storm frequency have been determined for the offsite and future project site using the Rational Method. Pre-development and post-development peak flow rates for the 100-year, 24 hour storm frequency have been determined for the project site using the Unit Hydrograph Method.

II. SITE AREA

A. Area Characteristics

The Prescott Commercial Center is located on the southeast corner of the intersection at Prescott Avenue and Twenty-nine Palms Highway (Hwy) 62, in a portion of the northeast quarter of Section 31, Township 1 North, Range 6 East, San Bernardino Meridian, San Bernardino County, California.

B. Soils Group

According to Plate C-3 of the San Bernardino County Flood Control District (SBCFCD) Hydrology Manual (copy enclosed in Appendix I), the entire onsite watershed is within a

Soil Type "B" and has been used for the hydrologic parameters of the Rational Method and Unit Hydrograph Analysis. The offsite watershed has been determined to be Soil Type "B".

C. Land Use

Land Use Zoning classification for this study is a Commercial Development.

D. Flood Insurance Rate Maps (FIRM)

The site is located in Zone X of the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRM), San Bernardino County, California and incorporated areas panel 8120 of 9400 with map number 06071C8120H dated August 28, 2008. A Zone X is designation as areas determined to be outside of the 0.2% annual chance floodplain. The FIRM map for this project is located in Appendix I.

E. Drainage Master Plan

There are no proposed master plans of drainage facilities on or adjacent to the proposed site development per the Yucca Valley Master Plan of Drainage (YVMPD). A copy of the YVMPD "Yucca Valley Master & Proposed Drainage Facilities Figure 2" exhibit is included in Appendix I.

III. HYDROLOGIC METHODOLOGY

A. Rational Method

The materials included with this study are presented to satisfy the requirements set forth in the *San Bernardino County Flood Control District* (SBCFCD) Hydrology Manual. All pre- and post-development, watershed basin runoff values were generated by the use the Rational Method. Applicable input and output files for this method can be found in the Appendix II of this report.

B. Synthetic Unit Hydrograph Method

The Synthetic Unit Hydrograph method was used to generate peak 100-year, 24 hour flow values (worst case scenario). The Synthetic Unit Hydrograph results are used to determine the total volume of watershed runoff for both the pre- and post-development conditions. The rainfall intensity figures that were used to compute the Unit Hydrograph Method are located in Appendix I of this report.

C. Storm Frequency

Per *San Bernardino County* criteria, the 100-year, 1-, 6-, 24- hour storm frequency was used to calculate peak flows using the Rational and/or Unit Hydrograph Method. The

hydrologic frequency obtained from the San Bernardino County Isohyetal Maps are 1.28 (offsite/onsite), 2.20 (offsite/onsite) and 4.20 (offsite/onsite), respectively. Per *San Bernardino County* criteria, the 100-year, 24 hour frequency storm was used to calculate both peak flow rates and the total runoff volume using the Unit Hydrograph Method.

IV. HYDROLOGIC AND HYDRAULIC RESULTS

A. Rational Method – Offsite Basins and Pre- and Post Onsite Conditions

Table 1 below illustrates the 100-year, 24 hour peak discharge values at the most downstream point for the offsite and 100-year, 1 hour pre-development and post-development conditions. Detailed hydrologic calculations can be found in Appendix II of this report.

An offsite basin of approximately 45.11 acres impacts the project site along the westerly boundary of the development. These values are also located in the Table 1 below and a detailed analysis is provided in Appendix II of this report.

The proposed onsite runoff value for Prescott Commercial Center is provided in the Table 1 below. These values will be used to determine onsite retention sizing to help convey excessive onsite storm water runoff generated for the proposed commercial center.

TABLE 1
EXISTING OFFSITE AND ONSITE PEAK FLOW RATES

Rational Method (1 hr) Basin (Offsites)	Area (acres)	100-year (cfs) 1 hour Peak Flow
¹ OFFSITE-EX	45.11	105.38
ONSITE-EX	3.32	7.37
Total	48.43	
Unit Hydrograph (24 hr) Basin (Onsite)	Area (acres)	100-year (cfs), 24 hour Peak Flow
² ONSITE-EX	2.50	6.80
² ONSITE-PR	2.50	7.16
Total	2.50	

¹OFFSITE-EX basins includes southerly basins and existing commercial to the west of the proposed development.

²Onsite basins – Proposed and Existing conditions.

B. Synthetic Unit Hydrograph Method - Pre and Post Onsite Development

The results of the Unit Hydrograph for both onsite peak flow rates and total volume for pre-development and post-development can be found in the Table 2 below. A detailed hydrologic calculation can be found in the Appendix II of this report.

TABLE 2
PRE AND POST ONSITE DEVELOPMENT PEAK VOLUME RESULTS

Basin (Condition)	Unit Hydrograph Total Volume (ac-ft)		Incremental Increase (ac-ft)
	Computed Volume (ac-ft)	Condition	
ONSITE (EX ¹)	0.6499	Pre-Development	0.1284
ONSITE (PR ²)	0.7783	Post-Development	
Basin	Incremental Increase (ac-ft)	Additional 20% of the Incremental Increase (ac-ft)	Total Storage (ac-ft)
ONSITE	0.1284	0.0256	0.1541 ³

¹Abbreviation for EX is defined as Existing Condition.

²Abbreviation for PR is defined as Proposed Condition.

³Total Storage is computed by Incremental Increase plus 20% of the Incremental Increase.

C. Mitigation of Nuisance Water

Nuisance (onsite) flows shall be conveyed through valley and/or ribbon gutters, and L-type curb and gutter, drainage easements (if any), and storm drain systems to be discharged onto the proposed/future onsite retention basin(s). Nuisance flows generated by offsite irrigation, etc. shall be conveyed onto L-type curb and gutter along the exterior streets and captured by catch basins at the intersection of Prescott Avenue and Twentynine Palms Highway. A dry well will be attached to the catch basin located on Prescott to further contain nuisance flow.

V. SUMMARY

A. Recommendations

The following recommendations have been provided to facilitate safety, both public and private, for the proposed commercial development.

1. Proposed finished floors elevations for the commercial development shall be determined by the Final Drainage Study for the onsite conditions. Note, offsite street improvements and commercial driveways shall be constructed according to the offsite plans.
2. A Final Drainage study shall address any modification or changes for the offsite and onsite drainage conditions. This Preliminary Study only address the existing offsite and onsite watershed basin(s) and concentrated flows on the exterior streets.

3. Construct offsite local street improvements and commercial driveways as shown on the offsite street improvement plans.
4. Entrances along Prescott Avenue and Palisades Street shall be elevated to prevent stormwater from entering the site. Offsite flows shall flow around the site and shall be released at pre-development locations.

B. Conclusions

Development of the Prescott Commercial will be accomplished in a manner that will maintain historical downstream flow patterns. The commercial development should not adversely impact surrounding or downstream properties and the effects of post-development incremental increase flows shall be discussed in the Final Drainage Study for the onsite development. A portion of the nuisance flows generated from the offsite shall be mitigated by the proposed dry well on Prescott Avenue.

Unit Hydrograph Analysis

Copyright (c) CIVILCADD/CIVILDESIGN, 1989 - 2004, Version 7.0

Study date 02/08/13

+++++-----

San Bernardino County Synthetic Unit Hydrology Method
Manual date - August 1986

Program License Serial Number 6192

PRESCOTT COMMERCIAL CENTER - UNIT HYDROGRAPH - JOB NO. PDB024100
PROPOSED ONSITE CONDITION
100-YEAR STORM EVENT, 24 HOUR RAINFALL
BY JMA 2-08-13

Storm Event Year = 100

Antecedent Moisture Condition = 2

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

English Units used in output format

Area averaged rainfall intensity isohyetal data:

Sub-Area (Ac.)	Duration (hours)	Isohyetal (In)
Rainfall data for year 100		
2.50	1	1.28

Rainfall data for year 100		
2.50	6	2.20

Rainfall data for year 100		
2.50	24	4.20

+++++-----
***** Area-averaged max loss rate, Fm *****

SCS curve No. (AMCII)	SCS curve NO. (AMC 2)	Area (Ac.)	Area Fraction	Fp(Fig C6) (In/Hr)	Ap (dec.)	Fm (In/Hr)
56.0	56.0	2.50	1.000	0.734	0.100	0.073

Area-averaged adjusted loss rate Fm (In/Hr) = 0.073

***** Area-Averaged low loss rate fraction, Yb *****

Area	Area	SCS CN	SCS CN	S	Pervious
------	------	--------	--------	---	----------

(Ac.)	Fract	(AMC2)	(AMC2)	Yield	Fr
0.25	0.100	56.0	56.0	7.86	0.157
2.25	0.900	98.0	98.0	0.20	0.944

Area-averaged catchment yield fraction, $Y = 0.865$

Area-averaged low loss fraction, $Y_b = 0.135$

Direct entry of lag time by user

+++++
Watershed area = 2.50(Ac.)

Catchment Lag time = 0.176 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 47.2947

Hydrograph baseflow = 0.00(CFS)

Average maximum watershed loss rate(Fm) = 0.073(In/Hr)

Average low loss rate fraction (Y_b) = 0.135 (decimal)

DESERT S-Graph Selected

Computed peak 5-minute rainfall = 0.607(In)

Computed peak 30-minute rainfall = 1.040(In)

Specified peak 1-hour rainfall = 1.280(In)

Computed peak 3-hour rainfall = 1.784(In)

Specified peak 6-hour rainfall = 2.200(In)

Specified peak 24-hour rainfall = 4.200(In)

Rainfall depth area reduction factors:

Using a total area of 2.50(Ac.) (Ref: fig. E-4)

5-minute factor = 1.000 Adjusted rainfall = 0.607(In)

30-minute factor = 1.000 Adjusted rainfall = 1.040(In)

1-hour factor = 1.000 Adjusted rainfall = 1.280(In)

3-hour factor = 1.000 Adjusted rainfall = 1.784(In)

6-hour factor = 1.000 Adjusted rainfall = 2.200(In)

24-hour factor = 1.000 Adjusted rainfall = 4.200(In)
