

## MEMORANDUM

To: Jared Jerome, Town of Yucca Valley  
From: Sophie LaHerran  
Ace Malisos  
Kimley-Horn and Associates, Inc.  
Date: June 18, 2020  
Subject: Yucca Valley Dominos Project – Air Quality and Greenhouse Gas Emissions

---

### Purpose

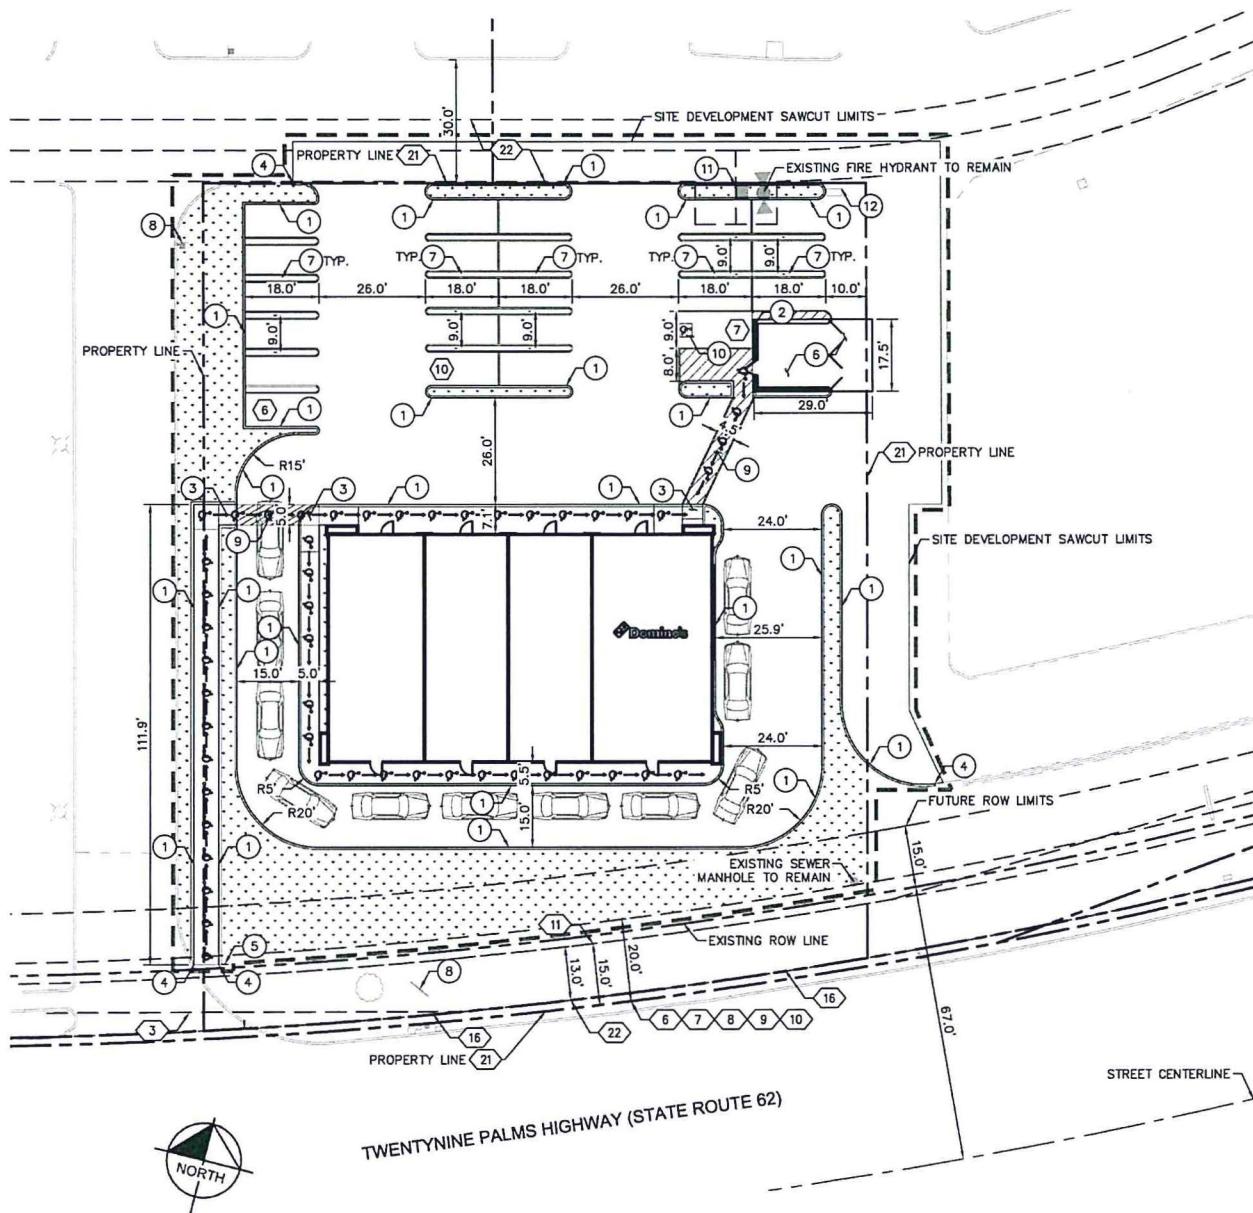

The purpose of this memorandum is to identify the air quality and greenhouse gas (GHG) emissions associated with construction and operations of the proposed Yucca Valley Dominos Project (project), located in Yucca Valley, California.

### Project Description

The project proposes to construct a Dominos restaurant and other fast-food restaurant uses, totaling approximately 5,000 square feet. The project site is located within the northwest quadrant of the Twentynine Palms Highway (State Route 62) and Balsa Avenue intersection as a stand-alone building within an existing shopping center. Land uses surrounding the site include single-family residences to the south across State Route 62, a restaurant and additional retail/commercial uses and surface parking to the north and east, a movie theatre and surface parking lot to the south, and a bowling alley across Balsa Avenue to the west.

Regional vehicular access to the site is provided by the State Route 62 (SR-62). The communities of Joshua Tree and Morongo Valley are located east and west of the project site. The project site plan is provided on **Figure 1: Site Plan**.

**Figure 1: Site Plan**

## Air Quality Impacts

### MDAQMD Mass Emission Thresholds

MDAQMD's significance criteria are used to make the above determinations. According to the MDAQMD, an air quality impact is considered significant if a project would violate any NAAQS or CAAQS, contribute substantially to an existing or projected air quality violation, or expose sensitive receptors to substantial pollutant concentrations. The MDAQMD has established thresholds of significance for air quality during construction and operational activities of land use development projects, as shown in **Table 1: Mojave Desert Air Quality Management District Emissions Thresholds**. These mass emissions thresholds are pollutant limits described in pounds per day and tons per year. The project emissions are quantified using the methods described above and compared to the MDAQMD's thresholds.

Table 1: Mojave Desert Air Quality Management District Emissions Thresholds		
Pollutants	Annual Thresholds (tons)	Daily Thresholds (pounds)
Greenhouse Gases (CO <sub>2</sub> e)	100,000	548,000
Carbon Monoxide (CO)	100	548
Nitrogen Oxides (NO <sub>x</sub> )	25	137
Volatile Organic Compounds (VOC)	25	137
Sulfur Oxides (SO <sub>x</sub> )	25	137
Coarse Particulates (PM <sub>10</sub> )	15	82
Fine Particulates (PM <sub>2.5</sub> )	12	65

*Source: Mojave Desert Air Quality Management District, MDAQMD CEQA and Federal Conformity Guidelines, April 2016.*

A significant project must incorporate mitigation sufficient to reduce its impact to a level that is not significant. A project that cannot be mitigated to a level that is not significant must incorporate all feasible mitigation. The emission thresholds are given as a daily value and an annual value, so that multi-phased project (such as project with a construction phase and a separate operational phase) with phases shorter than one year can be compared to the daily value.

### Construction Emissions

Construction associated with the proposed project would generate short-term emissions of criteria air pollutants. The criteria pollutants of primary concern within the project area include ozone-precursor pollutants (i.e., ROG and NO<sub>x</sub>), PM<sub>10</sub>, and PM<sub>2.5</sub>. Construction-generated emissions are short term and of temporary duration, lasting only as long as construction activities occur, but would be considered a significant air quality impact if the volume of pollutants generated exceeds the MDAQMD's thresholds of significance.

Construction results in the temporary generation of emissions resulting from demolition, site grading, road paving, motor vehicle exhaust associated with construction equipment and worker trips, and the movement of construction equipment, especially on unpaved surfaces. Emissions of airborne particulate matter are largely dependent on the amount of ground disturbance associated with site preparation activities as well as weather conditions and the appropriate application of water.

The duration of construction activities for the project is estimated to be approximately 5 months, beginning in early 2021. The project would demolish the existing parking lot and construct a single-story, Dominos Drive-Thru on the project site and associated parking. Construction-generated emissions associated the proposed project were calculated using the CARB-approved California Emissions Estimator Model version 2016.3.2 (CalEEMod), which is designed to model emissions for land use development projects, based on typical construction requirements. See Appendix A (Air Quality and GHG Data) for more information regarding the construction assumptions used in this analysis. Predicted maximum daily construction-generated emissions for the proposed project are identified in **Table 2: Project Construction Emissions**.

<b>Table 2: Project Construction Emissions</b>						
<b>Construction Year</b>	<b>Emissions (pounds per day)<sup>1</sup></b>					
	<b>ROG</b>	<b>NO<sub>x</sub></b>	<b>CO</b>	<b>SO<sub>2</sub></b>	<b>PM<sub>10</sub></b>	<b>PM<sub>2.5</sub></b>
2021	3.83	9.83	9.38	0.02	2.37	0.82
MDAQMD Threshold	n/a	137	548	137	82	65
<b>MDAQMD Threshold Exceeded?</b>	<b>n/a</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>

Notes:

1. MDAQMD Rule 403 Fugitive Dust applied. The Rule 403 reduction/credits include the following: properly maintain mobile and other construction equipment; replace ground cover in disturbed areas quickly; water exposed surfaces three times daily; replace ground cover of area disturbed; water all haul roads twice daily; and limit speeds on unpaved roads to 15 miles per hour. Reductions percentages from the South Coast Air Quality Management District (SCAQMD) CEQA Handbook (Tables XI-A through XI-E) were applied. No mitigation was applied to construction equipment. Refer to Appendix A for Model Data Outputs.

Source: CalEEMod version 2016.3.2. Refer to Appendix A for model outputs.

**Table 2** shows that construction pollutant emissions would remain below their respective thresholds with implementation of required MDAQMD Rule 403.2. The project would also be required to comply with MDAQMD Rules 402 and 1113, which prohibit nuisances and limit VOC content in paints, respectively. Compliance with MDAQMD rules 402 and 1113 would further reduce specific construction-related emissions. As shown above, all criteria pollutant emissions would remain below their respective thresholds and impacts would be less than significant.

## Operational Emissions

Operational emissions are typically associated with mobile sources (i.e., motor vehicle use) and area sources (such as the use of landscape maintenance equipment, hearths, consumer products, and architectural coatings). Energy source emissions would be generated from electricity and natural gas (non-hearth) usage. **Table 3: Operational Emissions** summarizes the operational emissions attributable to the proposed project. As shown in **Table 3**, the project's emissions would not exceed MDAQMD thresholds. Therefore, regional operations emissions would result in a less than significant long-term regional air quality impact.

Source	Emissions (pounds per day) <sup>1</sup>					
	ROG	NO <sub>x</sub>	CO	SO <sub>2</sub>	PM <sub>10</sub>	PM <sub>2.5</sub>
<b>Project Emissions</b>						
Area	0.15	0.00	0.00	0.00	0.00	0.00

Mobile	6.01	34.44	37.77	0.13	7.28	2.00
<b>Total</b>	<b>6.20</b>	<b>34.81</b>	<b>38.08</b>	<b>0.13</b>	<b>7.31</b>	<b>2.03</b>
MDAQMD Threshold	n/a	137	548	137	82	65
MDAQMD Threshold Exceeded?	n/a	No	No	No	No	No
Notes:						
1. Emissions were calculated using the California Emissions Estimator Model version 2016.3.2 (CalEEMod), as recommended by the MDAQMD. Worst-case seasonal maximum daily emissions are reported.						

## Carbon Monoxide Hotspots

An analysis of CO “hot spots” is needed to determine whether the change in the level of service (LOS) of an intersection from the proposed project would have the potential to result in exceedances of the CAAQS or NAAQS. It has long been recognized that CO exceedances are caused by vehicular emissions, primarily when vehicles are idling at intersections. Vehicle emissions standards have become increasingly stringent in the last 20 years. Currently, the CO standard in California is a maximum of 3.4 grams per mile for passenger cars (requirements for certain vehicles are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities, CO concentrations have steadily declined.

Accordingly, with the steadily decreasing CO emissions from vehicles, even very busy intersections do not result in exceedances of the CO standard. MDAQMD has not established CO hotspot methodology. However, according to the Traffic Circulation Study prepared by Kimley-Horn (June 2, 2020), the project would not cause an intersection to operate an unacceptable LOS.

Additionally, the 2003 *Air Quality Management Plan* is the most recent AQMP that addresses CO concentrations. As part of the SCAQMD CO Hotspot analysis, the Wilshire Boulevard/Veteran Avenue intersection, one of the most congested intersections in Southern California with an average daily

traffic (ADT) volume of approximately 100,000 vehicles per day, was modeled for CO concentrations. The proposed project considered herein would not produce the volume of traffic required to generate a CO hot spot in the context of SCAQMD's 2003 CO hot-spot analysis. As the CO hotspots were not experienced at the Wilshire Boulevard/Veteran Avenue intersection even as it accommodates 100,000 vehicles daily, it can be reasonably inferred that CO hotspots would not be experienced at any vicinity intersections from 1,558 daily vehicle trips<sup>1</sup> attributable to the project. Therefore, impacts would be less than significant in this regard.

## Greenhouse Gas Emissions

The project would include direct and indirect GHG emissions from project construction and operations. Construction is considered a direct source since these emissions occur at the site. Direct operational-related GHG emissions for the proposed project would include emissions from area and mobile sources, while indirect emissions are from energy consumption, water demand, and solid waste.

### Construction GHG Emissions

Construction of the project would result in direct emissions of CO<sub>2</sub>, N<sub>2</sub>O, and CH<sub>4</sub> from construction equipment and the transport of materials and construction workers to and from the project site. Construction GHG emissions are typically summed and amortized over the lifetime of the project (assumed to be 30 years), then added to the operational emissions.<sup>2</sup> Total GHG emissions generated during all phases of construction were combined and are presented in **Table 4: Construction Greenhouse Gas Emissions**. The CalEEMod outputs are contained within Appendix A (Air Quality and GHG Data). As shown in **Table 4**, the project construction would result in 73 MTCO<sub>2</sub>e (approximately 2.4 MTCO<sub>2</sub>e/year when amortized over 30 years).

<b>Table 4: Construction Greenhouse Gas Emissions</b>	
<b>Construction</b>	<b>MTCO<sub>2</sub>e per Year</b>
Total Construction	73

Source: CalEEMod version 2016.3.2. Refer to Appendix A for model data outputs.

### Operational GHG Emissions

Operational or long-term emissions occur over the life of the proposed project. GHG emissions would result from direct emissions such as project generated vehicular traffic, on-site combustion of natural gas, operation of any landscaping equipment. Operational GHG emissions would also result from indirect sources, such as off-site generation of electrical power over the life of the project, the energy

<sup>1</sup> Kimley-Horn, *Yucca Valley Dominos Traffic Circulation Study*, June 2020.

<sup>2</sup> The project lifetime is based on the standard 30-year assumption of the South Coast Air Quality Management District (South Coast Air Quality Management District, *Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #13*, August 26, 2009).

required to convey water to, and wastewater from the project site, the emissions associated with solid waste generated from the project site, and any fugitive refrigerants from air conditioning or refrigerators. **Table 5: Total Project Greenhouse Gas Emissions** summarizes the total GHG emissions associated with proposed project. As shown, the project would generate approximately 1,726 MTCO<sub>2</sub>e/year. The project would not result in an increase in GHG emissions that exceed the MDAQMD's screening threshold of 100,000 MTCO<sub>2</sub>e/yr. Therefore, project-related GHG emissions would be less than significant.

Source: CalEEMod version 2016.3.2. Refer to Appendix A for model data outputs.	

## Conclusion

Project implementation would result in less than significant short- and long-term air quality and GHG impacts. No mitigation measures would be required.
